

00 - Visual System Overview

Big Idea

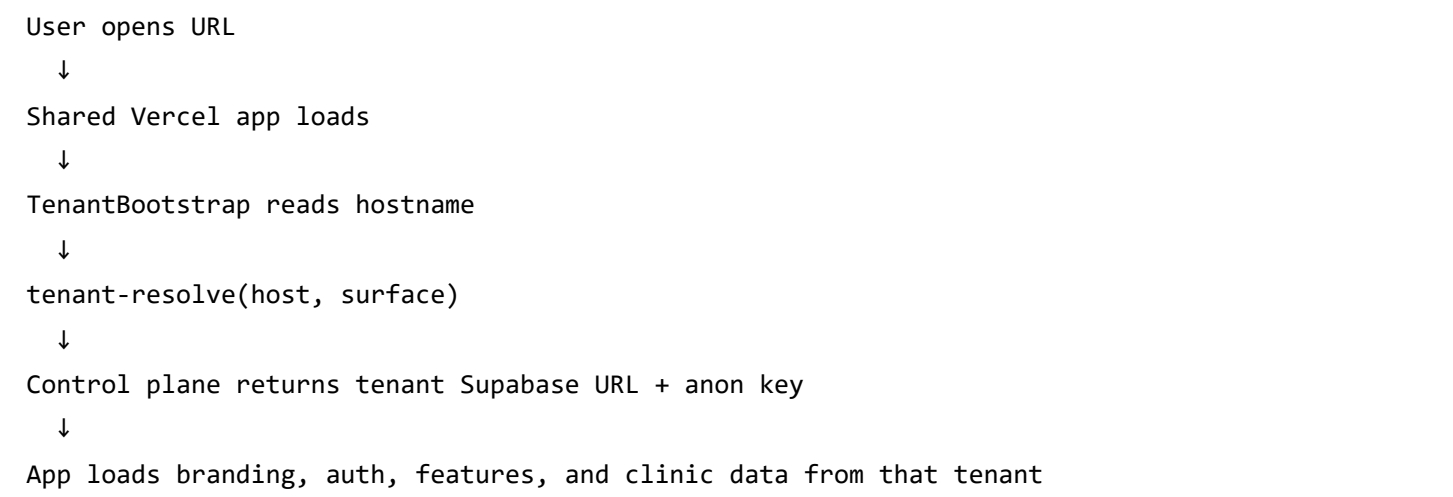

DoctoLeb uses shared apps on Vercel and separate Supabase tenant databases for clinics.

Three Decisions

Question	Answer
One Vercel project per doctor?	No. One shared Vercel app per surface.
One database for all clinics?	No. Each clinic gets its own tenant Supabase project.
How does the app know the clinic?	The hostname or future path is resolved by the control plane.

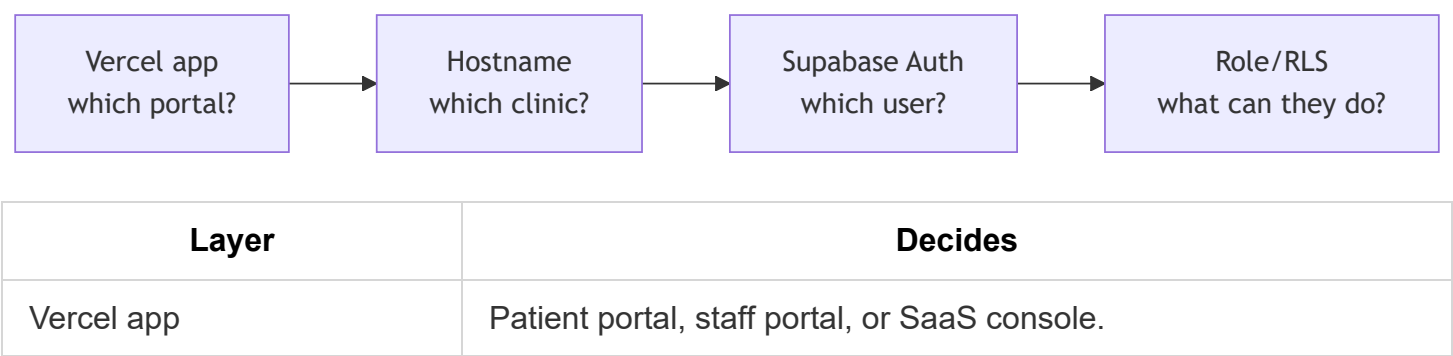

Routing Example

Example Domain Map

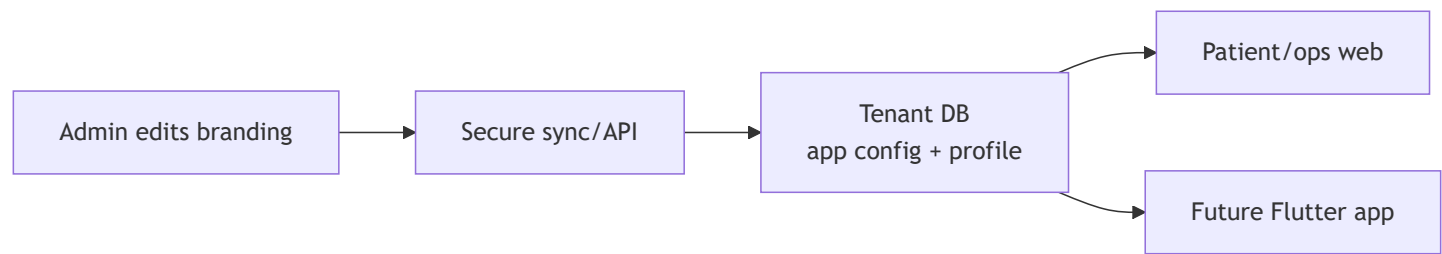

URL	Vercel App	Surface	Tenant
doctoleb-patient-web.vercel.app	patient-web	patient	dev tenant
doctoleb-clinic-ops.vercel.app	clinic-ops	ops	dev tenant
dr-hassan.doctoleb.com	patient-web	patient	dr-hassan
dr-hassan.ops.doctoleb.com	clinic-ops	ops	dr-hassan
hassanclinic.com	patient-web	patient	dr-hassan
ops.hassanclinic.com	clinic-ops	ops	dr-hassan

Identity Layers

Layer	Decides
Hostname	Which clinic tenant should load.
Supabase Auth	Which user is logged in.
Tenant RLS/RPCs	What data and actions the user can access.

Runtime Branding

Branding is data, not code. Changing clinic name, logo, colors, tagline, or support contact should not require a new deployment.
